World Environment Day 2023 - Solutions To Plastic Pollution

Naseem Sheikh

World Environment Day 2023 is a reminder that people's actions on plastic pollution matter. The steps governments and businesses are taking to tackle plastic pollution are contributing to a reduction in single-use plastic. It is time for citizens and businesses to step forward and join the spread use of plastic in our daily lives. The steps governments and businesses are taking to tackle plastic pollution are contributing to a reduction in single-use plastic. It is time for citizens and businesses to step forward and join the spread use of plastic in our daily lives.

Plastic pollution is one of our planet's most pressing environmental issues. With the wide usage of single-use plastics, plastic waste has become a significant problem, with plastic debris finding its way into our oceans, rivers, and even our food chains. While the problem of plastic pollution may seem impossible, several solutions can be implemented to tackle this issue. One solution to plastic pollution is increasing public awareness and education about the issue. Many people are not aware of the impacts of plastic pollution on the environment and the steps that can be taken to reduce plastic waste. By providing education and awareness campaigns, we can help mobilise communities and encourage action to tackle plastic pollution.

In total, people consume 1.2 million plastic bottles each year. Ninety-nine percent of these bottles are single-use. The plastic in these bottles is not recycled. A single plastic bottle is used for around half an hour before it is thrown away or burned. This is a significant problem, as plastic is not biodegradable and can take hundreds of years to decompose. Ninety-one percent of plastic waste ends up in landfills, polluting the air and water. Plastic pollution is also a threat to wildlife. Many animals, including sea turtles, whales, and seabirds, mistake plastic waste for food, leading to suffocation and death. Many animals, including sea turtles, whales, and seabirds, mistake plastic waste for food, leading to suffocation and death. Parent pollution is a significant problem, particularly in nations in Africa. The ban on single-use plastic bags in Pakistan is one of the cleanest in the world. The ban has halted the production of 400,000 kilograms of plastic per annum. These efforts got results, a survey conducted after a year in September 2021 showed that 90% of the participants said that the ban had increased their knowledge of plastic pollution. Thanks to regulation, the survey showed that all of the retailers involved had shifted towards using alternative bags.
